DSP Trigger is an easy-to-use application. It offers multiple features that increase the productivity of the user. The main features include a customizable throttle/sensitivity/synchronization functionality, a possibility to convert the trigger signal to MIDI notes, an option for separate play tracking, an ability to set starting and the end points of a pattern, and various display options. More information about the utility: Main Features: Ability to convert drum trigger signal

---

to MIDI notes in any time range;  
Separate track set (up to 30 tracks);  
Sensitivity (the amount of output signal required for drum pad to trigger); Change the starting/the end points of a pattern; Warnings / Settings: The automatic threshold will work on a drum pad whether it is activated or not. The display of the pads' parameters will show the threshold that the sample will trigger a note when the threshold is reached. The algorithm is optimized for a single pad which is why it may take some time to reach the threshold on a set of multiple pads. The maximum

---

number of pad in a pattern is limited by the USB bus. The number of pads with the same threshold will be reduced automatically. If that happens, you can add the number of pads manually. The display of the pads' properties will show the name of the track and the capacity of the pad and the pad type (standard, big or small). The dual mode provides two different modes of operation. In the drum pad mode, the track outputs will be connected to MIDI tracks in the host. In the sequencer mode, the track outputs are connected to the drum pad inputs of the sequencer. Multi-

---

button modes may be used to control the track configuration. Triggering and setting of the pads is automatic. You do not need to set any parameters for the trigger mode. The sampling rate affects the responsiveness of the drum pads. Set the sampling rate in order to optimize the performance of the drum pads. Two modes of display are available.

1. The "MIDI Trigger" mode will display the triggers as MIDI notes.
2. The "Sequencer" mode will display the triggers in a visual form.
3. A "Settings" window is available to change the number of pad in a pattern

---

and to control the display mode. 4.  
You can set the threshold

An investigation of the St Peter's basilica and nearby crypts have determined that the number of skeletons found inside the basilica is significantly higher than originally believed.

Additional findings suggest that most of the skeletons are those of people from the 18th century, though several older skeletons have been located in the crypts. The bodies were buried
